

Output:-

Enter the Starting number: 1

Enter the ending number : 50

Enter the Step value: 5

Task 8. Implement Python generator and decorators

Aim:-

Write a python program to implement python generators and decorators

Q1. Write a program that includes a generator function to produce a sequence of numbers. The generator should be able to:

- Produce a sequence of numbers when provided with start, end, and step values.

Program:-

```
def number_sequence (start, end, step=1):  
    current = start  
    while current <= end:  
        yield current  
        current += step  
start = int(input("Enter the starting number:"))  
end = int(input("Enter the ending number:"))  
step = int(input("Enter the step value:"))  
# Create the generator  
sequence_generator = number_sequence (start, end, step)  
# Print the generated sequence of numbers  
for number in sequence_generator:  
    print (number)
```

Q8 Imagine you are working on a messaging application that needs to format messages differently;

Algorithm:-

1. Create Decorators
2. Define functions
3. Define Greet function
4. Execute the Program.

Program:-

```
def uppercase_decorator(func):  
    def wrapper(text):  
        return func(text).upper()  
    return wrapper  
  
def lowercase_decorator(func):  
    def wrapper(text):  
        return func(text).lower()  
    return wrapper
```

@uppercase_decorator

```
def shout(text):  
    return text
```

@lowercase_decorator

```
def whisper(text):  
    return text
```

Output:-

HI, I AM CREATED

hi, i am created

```
def greet(func):  
    greeting = func ("Hi I am Created by a function passed as  
    an argument.")  
    print(greeting)  
greet (shout)  
greet (whisper)
```

Result :-

Thus, the python program to Implement python generator and
decorators was successfully executed and the output was verified
